

PROJECT BRIEF

# Build a Task Management Application

A fast, focused tool for one person to capture, organize, prioritize and complete work across projects.

Single user

Desktop first, mobile ready

Light and dark mode

Local storage only

# The scenario

One person manages personal tasks and work across several projects. They work mostly on a desktop but also open the app on mobile. Every task should flow through five moves without extra navigation:

1

## Capture

Add a task in seconds

2

## Organize

Group it by project

3

## Prioritize

Low, medium or high

4

## Schedule

Give it a due date

5

## Complete

Tick it off the list

It should feel like a modern productivity app, **not a complex project-management suite.**

# Design principles

No reference design is provided. Design from scratch, guided by these eight rules.

## Minimal interface

Only what helps the user act.

## Clear typography

Hierarchy through size and weight.

## Generous spacing

Room to breathe between items.

## Subtle borders

Soft lines and light shadows.

## Responsive layout

Works on desktop and mobile.

## Light and dark

Both themes, equally polished.

## Keyboard friendly

Core actions without a mouse.

## No clutter

Avoid needless visual complexity.

# The task record

| Field       | Type          | Values                         | Rule      |
|-------------|---------------|--------------------------------|-----------|
| Title       | Text          | —                              | Required  |
| Description | Long text     | —                              | Optional  |
| Due date    | Date          | —                              | Optional  |
| Priority    | Choice        | low · medium · high            | Required  |
| Status      | Choice        | todo · in progress · completed | Required  |
| Project     | Select or tag | one of the projects            | Optional  |
| Created     | Timestamp     | set on creation                | Automatic |

## SEED DATA

**3 projects**  
**6 tasks**

Spread across the projects, so the app never opens empty on first run.

# Tasks and projects

## Task management

- Add, edit and delete a task
- Mark complete, or reopen
- Change status, priority, due date, project and description

## Projects

- Create, rename and delete a project
- Assign tasks to a project
- Show a task count per project

Created date

A to Z

# The dashboard

Five summary counts, so the user sees the state of their work at a glance.

Numbers are illustrative only.

# Interaction and feedback

## Click to open

Clicking a task opens its detail and edit view.

## Complete from the list

Completion toggles without opening the task.

## Clear states

Overdue tasks stand out; completed tasks are subdued.

## Confirm deletes

Deleting a task always asks for confirmation.

## Toasts and empty states

Every action gets feedback; empty views explain what to do.

## Keyboard and themes

Keyboard support, light and dark mode, desktop and mobile.

# Local only. Survives a refresh.

Store everything in the browser, for example in `localStorage`. No server and no sync, but nothing is lost when the page reloads.

# Out of scope

Do not build any of the following.

**NOT INCLUDED**

**Login, registration or any authentication**

**NOT INCLUDED**

**A backend or database server**

**NOT INCLUDED**

**Payments**

**NOT INCLUDED**

**Multi-user functionality**

**NOT INCLUDED**

**External API dependencies**

**NOT INCLUDED**

**Calendar, chat or enterprise PM features**

# Push the code to GitHub

## 1 Create a repository

On github.com, empty, no README

```
github.com/new → name: task-manager → Create
```

## 2 Commit locally

From the project folder

```
git init
git add .
git commit -m "Initial commit"
```

## 3 Connect and push

Use your own GitHub username

```
git branch -M main
git remote add origin https://github.com/<you>/task-manager.git
git push -u origin main
```

# Deploy it on Vercel

1

## Sign in

Log in to vercel.com with your GitHub account.

2

## Import the repo

Add New › Project, then import task-manager.

3

## Deploy

Keep the detected framework settings and click Deploy.

4

## Share the link

You get a live URL ending in .vercel.app.

## Automatic updates

Every push to main redeploys. Every pull request gets its own preview URL.

## Good to know

Data stays in each visitor's browser, so everyone starts from the seed data.

**Submit:** the GitHub repository link and the live Vercel URL.

# Understood in seconds, without documentation.

A user opens the app and immediately knows how to:
